

MISP and GDPR

GDPR and privacy support in general in MISP

CIRCL

Computer Incident
Response Center
Luxembourg

7th May 2018

Challenges with MISP

- MISP is first and foremost an information sharing platform, leading to a lot of questions from users about GDPR
- We are of the firm belief that GDPR is an **enabler for information sharing**, organisations have to use any technical measure to protect the data of their constituents
- Threat information sharing is such a **technical measure**

Design principles

- MISP has always been designed with a strong focus on privacy, with a host of supporting features
- Pseudo-anonymisation of the information source via the **delegation** system
- Flexible distribution model to restrict sensitive information
- Automatic anonymisation of certain types of data to avoid accidental leaking of personal data

New developments to support the GDPR

- **GDPR Taxonomy**
- **Noticelist** system along with the GDPR notice list
- **Extended events** to support the private extension of 3rd party data
- Data portability support with simple **user export**
